DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over the applicant's admission of prior art (AAPA) in view of Pfoh et al. (US Patent 5,400,379). AAPA discloses a method of imaging an organ (Page 5, line 1) comprising scanning with a source and detector coupled to a rotating gantry and reconstructing an image (Fig. 6 and 9). However, AAPA does not seem to specifically disclose acquiring data from a plurality of staggered half detector segments.

Pfoh et al. discloses acquiring data from a plurality of staggered half detector segments (Fig. 4b and abstract, line 4).

It would have been obvious, to one of ordinary skill in the art at the time the invention was made, to acquire data from a plurality of staggered half detector segments of Pfoh et al. with the imaging method of the applicant's admission of prior art since one would be motivated to obtain more acquire multiple slices during a single revolution of the gantry as shown by Pfoh et al. (col. 1, lines 58-69).

Application/Control Number: 09/750,387

[•] Art Unit: 2882

2. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over AAPA in view of Pfoh et al. as applied to claim 1 above, and in further view of Cuppen (US Patent 6,259,766).

AAPA in view of Pfoh et al. suggests a method as recited above. However, AAPA does not seem to specifically disclose acquiring data with different resolutions as a function of position in the x-direction.

Cuppen discloses acquiring data with different resolutions as a function of position in the x-direction (Fig. 3).

It would have been obvious, to one of ordinary skill in the art at the time the invention was made, to acquire data with different resolutions of Cuppen with the imaging method of the applicant's admission of prior art in view of Pfoh et al. since one would be motivated to perform faster and more accurate volume reconstruction with a limited number of detector elements as shown by Cuppen (col. 1, lines 56-62).

3. Claims 3 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Toth et al. (US Patent 5982846) in view of AAPA. Regarding claim 3, Toth et al. discloses a detector array (Fig. 4) with a plurality of removable detector modules (Fig. 5, #20). However, it does not seem to specifically disclose a plurality of staggered half detector segments abutted about a centerline.

AAPA discloses staggered half detector segments abutted about a centerline (col. 4, lines 16-18, and Fig. 9).

It would have been obvious, to one of ordinary skill in the art at the time the invention was made, to have the staggered half detector segments of AAPA with the device of Toth et al.,

Application/Control Number: 09/750,387

· Art Unit: 2882

since one would be motivated to have obtain as much data from the radiation as implied in Fig. 9 of AAPA.

4. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Toth et al. in view of AAPA as applied to claim 3 above, and further in view of Cuppen. Toth et al. in view of AAPA suggest a device as recited above. However, Toth et al. does not seem to specifically disclose different number of outputs per module as a function of location in the x-direction.

Cuppen teaches different number of outputs per module as a function of location in the x-direction (col. 5, lines 45-55).

It would have been obvious to one having ordinary skill in the art at the time the invention was made, to have the different output of Cuppen with the device of Toth et al. in view of AAPA, since one would be motivated to perform faster and more accurate volume reconstruction with a limited number of detector elements as shown by Cuppen (col. 1, lines 56-62).

5. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Toth et al. in view of AAPA and Cuppen as applied to claim 7 above, and further in view of Hsieh (US Patent 5974109). Toth et al. in view of AAPA and Cuppen sugget a device as recited above. However, Toth et al. does not seem to specifically disclose paired cells.

Hsieh teaches paired cells (col. 2, lines 30-32).

It would have been obvious to one having ordinary skill in the art at the time the invention was made, to have the paired cells of Hsieh with the device of Toth et al. in view of

AAPA and Cuppen, since one would be motivated to avoid having to make any significant hardware and software changes to known multislice CT systems as shown by Hsieh (col. 2, lines 35-37).

Page 5

Allowable Subject Matter

- Claims 12-20 are allowed. 6.
- 7. Claims 4-6, 9, and 10 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:

Regarding claims 4, and 9, prior art does not specifically disclose or fairly suggest a radiation detector including a first type of module having flexible cables in two directions and a first type of module having flexible cable extending in one direction in combination with all the limitations in the respective claims and base claims.

Regarding claim 12, prior art does not specifically disclose or fairly suggest a CT imaging system including staggered half-detector segments wherein higher spatial resolution near a centerline and a lower spatial resolution distal to the center are used to attenuate data by utilizing the lower spatial resolution to reduce artifacts in combination with all the limitations in the claim.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chih-Cheng Glen Kao whose telephone number is (703) 605-5298. The examiner can normally be reached on M - Th (8 am to 5 pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robert Kim can be reached on (703) 305-3492. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 308-7722 for regular communications and (703) 308-7724 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0956.
